

---

Thank you for your purchase. In order to program the CR950 barcode scanners to work with AIMsi v11 or v12, users may have to scan one of programming commands listed below. These commands add a carriage return to the end of 1D barcode scans to advance the cursor to the next field position within AIMsi. The primary difference between the codes is that the second code (CC004364\_03) applies customized formatting to data scanned from driver licenses.

When first connecting the scanner to your PC, please wait a few minutes to allow Windows to fully install the drivers for the device.

**Note:** *These codes will not work on the CR900 or CR921 scanners.*

### V10 Compatible Format (DL Raw Data)

CC004414\_2

\*\*\*After scanning this programming code the scanner will beep several times. Wait approximately 5 seconds for the changes to be applied before scanning any barcodes.

### V11 and V12 Format (DL Parse)

CC004364\_03

\*\*\*After scanning this programming code the scanner will beep several times. Wait approximately 5 seconds for the changes to be applied before scanning any barcodes.
